

Crystal CS4329 DAC

(20 bit, Bitstream)

December 11, 1997

Parts Suppliers:

Digi-Key Corporation 701 Brooks Ave. South Thief River Falls, MN 56701

NOTES:

- The CS8414 receiver chip can be substituted for the CS8412, the CS4390 DAC chip can be substituted for the CS4329. This will add 24 bit / 96 KHz capability to the DAC
- There are four jumpers etched into the circuit board. If you make this circuit board, it will not have plated through holes, so the pads on either end of the jumpers must be connected from the signal side to the ground plane side of the board by soldering a small section of resistor lead on both sides in each of the 8 holes.
- S2 (Switch 2) is absolute phase inversion implemented in the digital domain. The switch is closed for normal phase, open for reversed phase.
- All parts except the crystal chips can be ordered from Digikey, the Digikey part numbers are listed in the parts list. Crystal Semiconductor has distributors worldwide, call or write to Crystal Semiconductor to find the location of the distributor nearest you.

BOARD ETCHING TECHNIQUE:

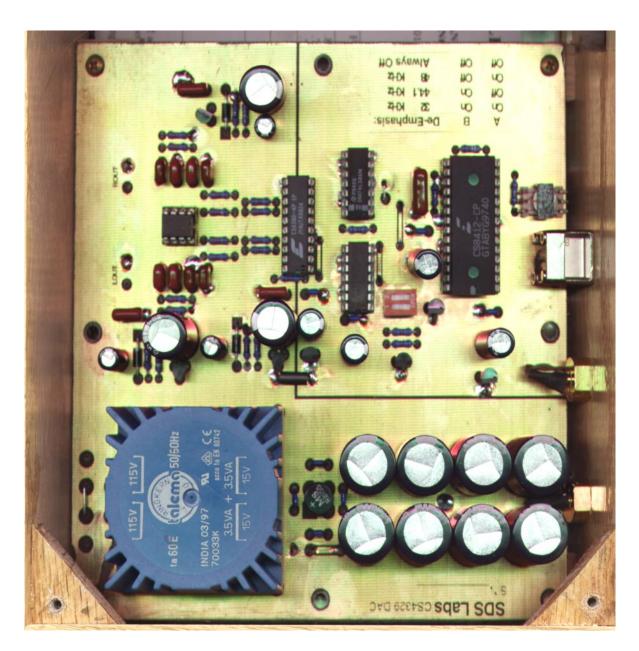

The artwork is printed onto transparency film from a laser printer, print it three times. Cut out two of the prints with about a quarter inch of clear space around the circuit board image. Then carefully tape these two copies to the uncut one after carefully aligning the traces of the overlay to the uncut sheet's traces. When finished, there should be three perfectly stacked copies. This increases the contrast of the final image. When a transparency is printed with a laser printer, there are usually holes in the black printed parts. And the blacks aren't all that black when it is held up to the light. Overlaying makes the blacks much more black, and gets rid of the holes. Now the artwork is ready to use.

This method uses GC^{\circledast} positive sensitized boards and developer. The FR-4 fiberglass 1 Oz. grade board works very well (they can be gotten local electronics stores). The board emulsion is sensitive to UV light, A good source of UV to expose the board is a GE^{\circledast} sunlamp. The sunlamp is hung so the bottom of the bulb is about 12" above the board. The exposure time is 9 minutes. With a yellow incandescent bug light-bulb on, pull the protective coating off the board and carefully align the artwork on top of the board. Then cover the artwork with a piece of glass to hold the artwork against the board (just like making a contact print in photography). Then turn the sun lamp on for 9 min. If a sunlamp is unavailable, the sun at noontime (on a clear day) can be used exposing the board for about 20 minutes.

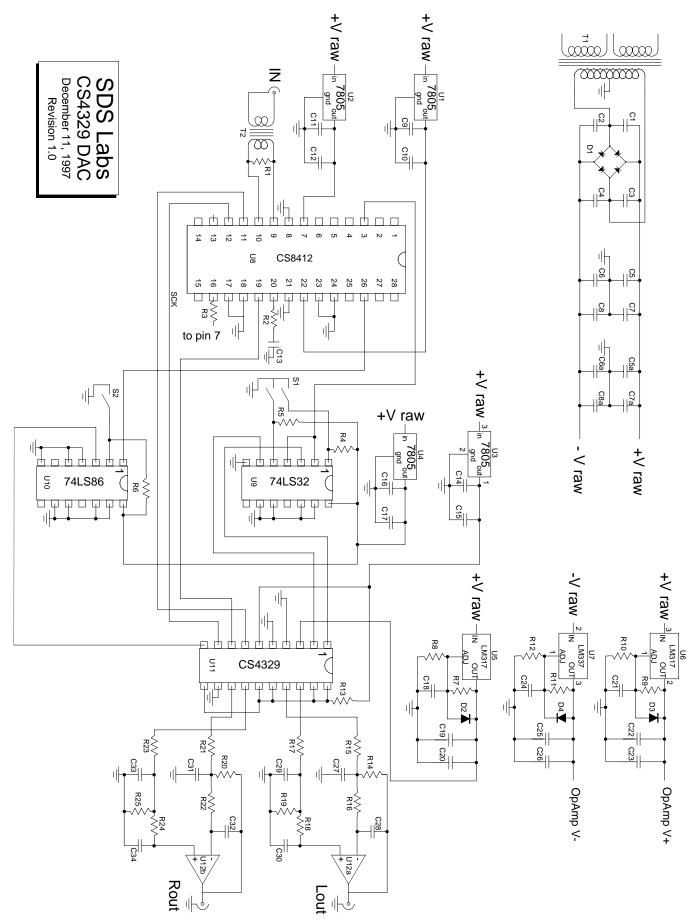

The exposed board gets dumped into the developer which has been mixed up beforehand. The developer says to use a 1:9 concentration of developer to water, but a 1:5 mix can be used, which works faster and can yield slightly better results. However the timing is more tricky, so it is not recommended for the first time. Submerge the board into the developer (A photography developer tray works very well), and rock the solution back and forth over the board. The exposed parts with start to dissolve. The emulsion is green and it will wash away exposing the copper underneath. This is the tricky part. The board must be removed when all the emulsion is off the exposed areas. If the board is removed too soon, the emulsion won't be completely dissolved off the exposed areas and it won't etch, if the board is in the developer too long all the emulsion dissolves and all that is left is a bare board. With the 1:9 solution this time window is about a minute, with a 1:5 solution it's about 20 seconds. The board is removed from the developer and washed off with room temperature water, then scrape at a an exposed area and see of there is any emulsion left there. if there is, place the board back in the developer for a few seconds. Repeat this as necessary until the exposed areas clear. With a little practice, it's pretty obvious when it's time to pull the board out. Do all the developing using the yellow bug light. When the board is done, wash it off and let it dry. Be careful of the emulsion, it's easily scratched, especially when fresh from the developer.

Next, drop the board into an etching solution. Ferric Chloride is available from the same electronic outlets where the $GC^{\text{(B)}}$ boards and developer are purchased or from Radio Shack^(B). Ferric Chloride is a nasty smelling, iodine looking, serious staining stuff. Pour out the developer from the tray, wash it out and add the etchant. Then put the board into the etchant and rock gently back and forth for about a half hour or so, until all the exposed areas are clear. Then remove the board and wash it clean. The emulsion can then be removed with acetone or alcohol.

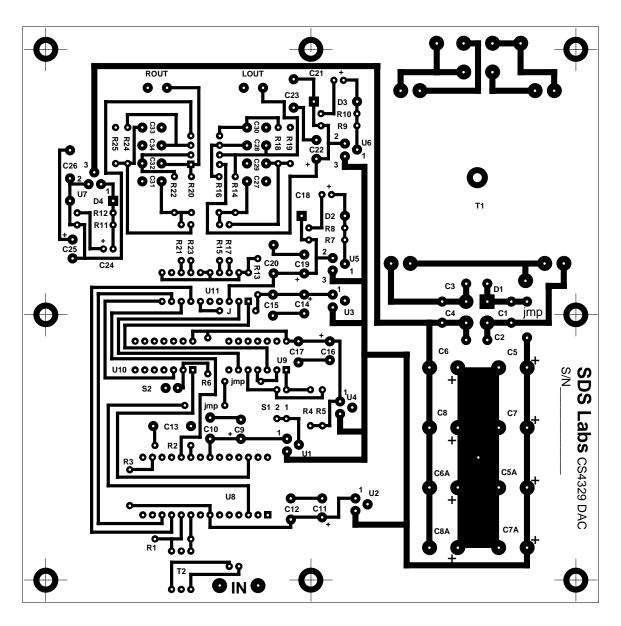

Then all the holes need to be drilled in the board. A Dremel[®] moto tool works well for drilling the small holes, a small drill press would also work.

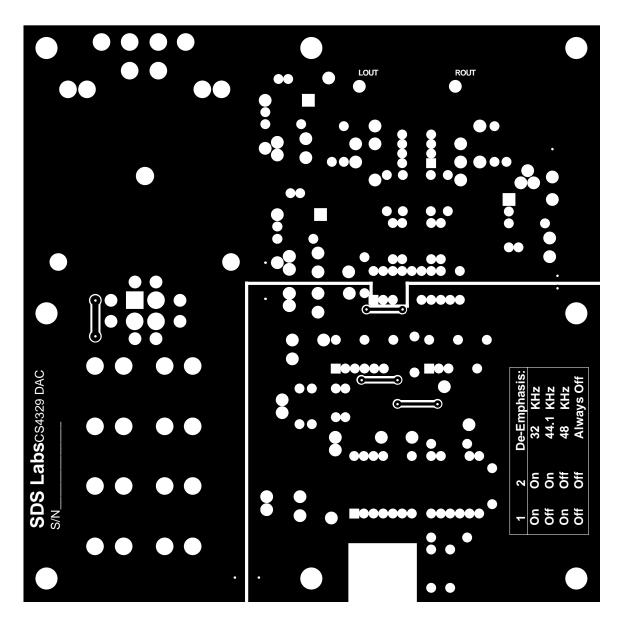

COMPLETED CS4329 DAC PROTOTYPE:
